### ABSTRACT

A robust, precise, and accurate reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the simultaneous estimation of Nirmatrelvir and Ritonavir in pharmaceutical tablet dosage form (Paxlovid). The chromatographic separation was performed on an Agilent C18 column (4.6 × 150 mm, 5 μm) with a mobile phase consisting of 0.01N potassium dihydrogen orthophosphate buffer (pH 3.0) and acetonitrile in the ratio 60:40, at a flow rate of 1.0 mL/min and detection wavelength of 292 nm. The retention times for Nirmatrelvir and Ritonavir were 2.121 min and 2.710 min, respectively. The method demonstrated excellent linearity ( $r^2 = 0.999$ ), precision (RSD < 2%), accuracy (recovery ~99.3–99.7%), sensitivity (LOD 0.02–0.06 μg/mL; LOQ 0.07–0.17 μg/mL), and robustness under varied conditions. Degradation studies confirmed the method's specificity and stability-indicating capability. The validated method is suitable for routine quality control and stability analysis in pharmaceutical industries.

**KEYWORDS:** Nirmatrelvir, Ritonavir, Stability-Indicating Method, Pharmaceutical Analysis, Degradation Studies.

### INTRODUCTION

Pharmaceutical analysis is a branch of practical chemistry that involves a process for identification, determination, quantification and purification of a substance, separation of the components of a solution or mixture. The wide variety of challenges is encountered while developing the methods for different drugs depending on its nature and properties. This along with the importance of achieving the selectivity, speed, cost, simplicity, sensitivity, reproducibility and accuracy of results gives an opportunity for researchers to come out with solution to address the challenges in getting the new methods of analysis to be adopted by the pharmaceutical industry and chemical laboratories. Different physico-chemical methods (1) are used to study the physical phenomenon that occurs as a result of chemical reactions. Among the physico-chemical methods, the most important are optical (refractometry, polarimetry, emission and fluorescence methods of analysis), photometry (photocolorimetry and spectrophotometry covering UV-Visible, IR Spectroscopy and nepheloturbidimetry) and chromatographic (column, paper, thin layer, gas liquid and high performance liquid chromatography) methods.

### MATERIALS AND INSTRUMENTS

The following materials used were either AR/LR grade or the best possible Pharma grade available as supplied by the manufacturer or supplier without further purification or investigation.

#### Chemicals and Solvents Used

- Nirmatrelvir and Ritonavir pure drugs (API), Combination Nirmatrelvir and Ritonavir tablets (**Paxlovid**) are received from spectrum lab
- Distilled water, Acetonitrile, Phosphate buffer, Methanol, Potassium dihydrogen orthophosphate buffer, Ortho-phosphoric acid.
- All the above chemicals and solvents are from Rankem

#### Instruments / Equipment required

- Volumetric flask- Glass, Class-A
- Beakers - Glass
- Measuring cylinder – Glass, Class-A, pH meter
- Volumetric pipettes- Glass, Class-A (graduated)
- Balance - Analytical balance and Micro balance
- Ultrasonicator
- UV-VIS spectrophotometer

**Preparation of Methods**

**Diluent:** Based up on the solubility of the drugs, diluent was selected, Acetonitrile and Water taken in the ratio of 50:50

**Preparation of Standard stock solutions:** Accurately weighed 7.5mg of Nirmatrelvir, 10mg of Ritonavir and transferred to 50ml and 100ml individual volumetric flasks and 3/4th of diluents was added to these flasks and sonicated for 10 minutes. Flask were made up with diluents and labeled as Standard stock solution. (150µg/ml of Nirmatrelvir and 100µg/ml Ritonavir).

**Preparation of Standard working solutions (100% solution):** 1ml from each stock solution was pipetted out and taken into a 10ml volumetric flask and made up with diluent. (15µg/ml of Nirmatrelvir and 10µg/ml Ritonavir).

**Preparation of Sample stock solutions:** 5 tablets were weighed and calculate the average weight of each tablet then the tablet powder weight equivalent to 150mg of Nirmatrelvir and 100mg of Ritonavir was transferred into a 500ml volumetric flask, 50ml of diluent added and sonicated for 30 min, further the volume made up with diluent and filtered. (300µg/ml of Nirmatrelvir and 200µg/ml of Ritonavir).

**Preparation of Sample working solutions (100% solution):** 1ml of filtered sample stock solution was transferred to 10ml volumetric flask and made up with diluent.(15µg/ml of Nirmatrelvir and 10µg/ml Ritonavir).

**Preparation of buffer**

**0.1%OPA Buffer:** (2.2pH) 1ml of ortho phosphoric acid was diluted to 1000ml with HPLC grade water.

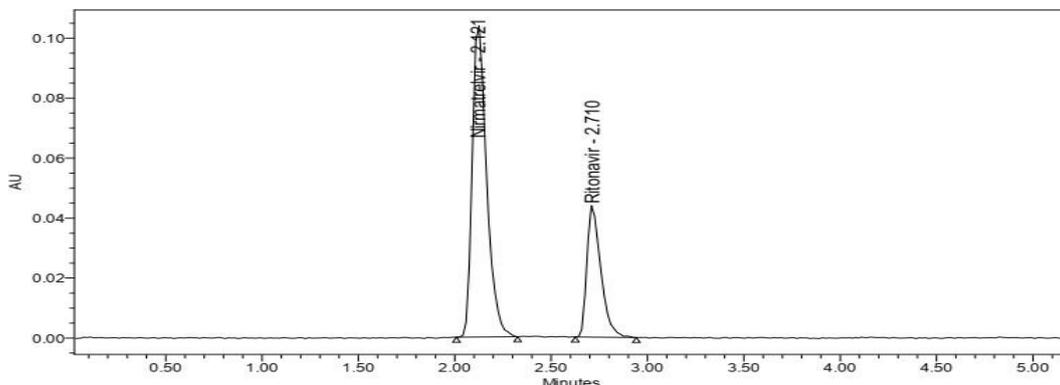

**Preparation of Standard stock solutions:** Accurately weighed 7.5mg of Nirmatrelvir, 10mg of Ritonavir and transferred to 50ml and 100ml individual volumetric flasks and 3/4th of diluents was added to these flask and sonicated for 10 minutes. Flask were made up with diluents and labeled as Standard stock solution. (150µg/ml of Nirmatrelvir and 100µg/ml Ritonavir)

**METHOD DEVELOPMENT**

Method development was done by changing the various ratio for mobile phase.

**Observation:** Nirmatrelvir and Ritonavir were eluted at 2.121min and 2.710 min respectively with good resolution. Plate count and tailing factor was very satisfactory, so this method was optimized and to be validated.

<b>Column</b>	<b>Agilent C18 (4.6 x 150mm, 5µm)</b>
Detector wave length	292nm
Flow rate	1 mL/min
Injection volume	10µL
Column temperature	30 °C

Diluent	Water and Acetonitrile in the ratio 50:50
Mobile Phase	60% 0.01N kh2po4 (3ph):40% Acetonitrile

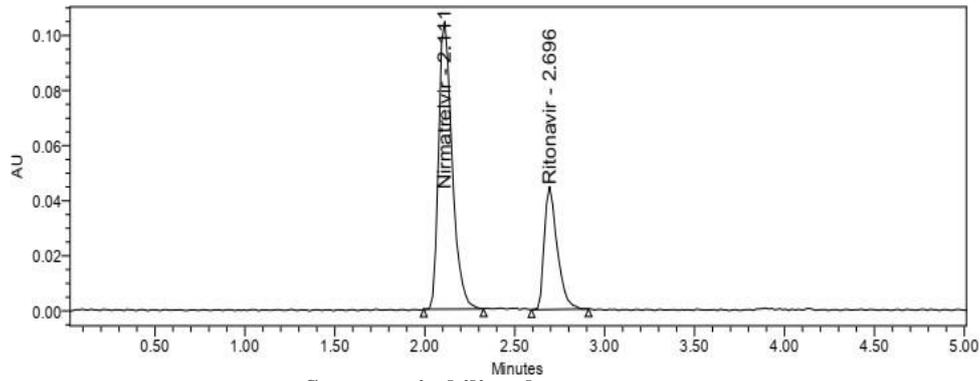

Optimized chromatographic condition

**RESULTS AND DISCUSSION**

**System suitability parameters for Nirmatrelvir and Ritonavir**

Sno	Nirmatrelvir			Ritonavir				
	Inj	RT(min)	USP Plate Count	Tailing	RT(min)	USP Plate Count	Tailing	Resoluton
1		2.050	3971	1.35	2.604	7314	1.50	4.4
2		2.096	3655	1.31	2.678	6818	1.55	4.1
3		2.110	3594	1.36	2.696	6178	1.41	4.1
4		2.111	3731	1.37	2.701	6893	1.54	4.3

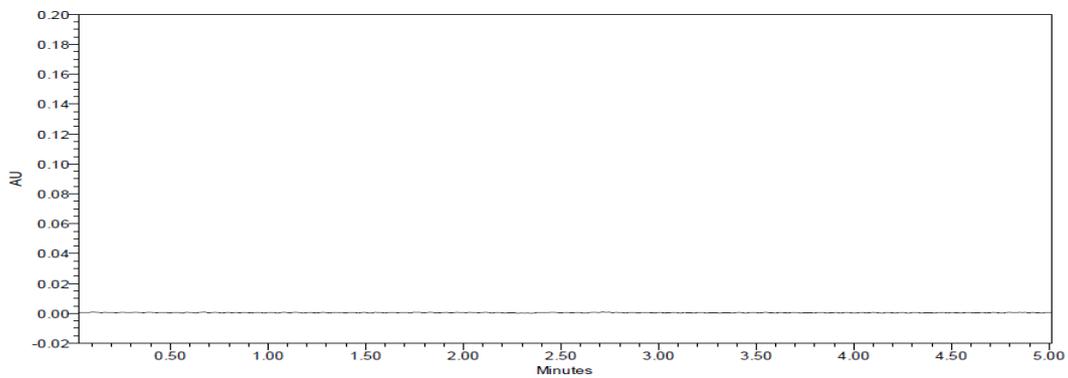

5	2.116	3493	1.34	2.702	6655	1.43	4.2
6	2.117	3380	1.32	2.703	6397	1.45	4.2

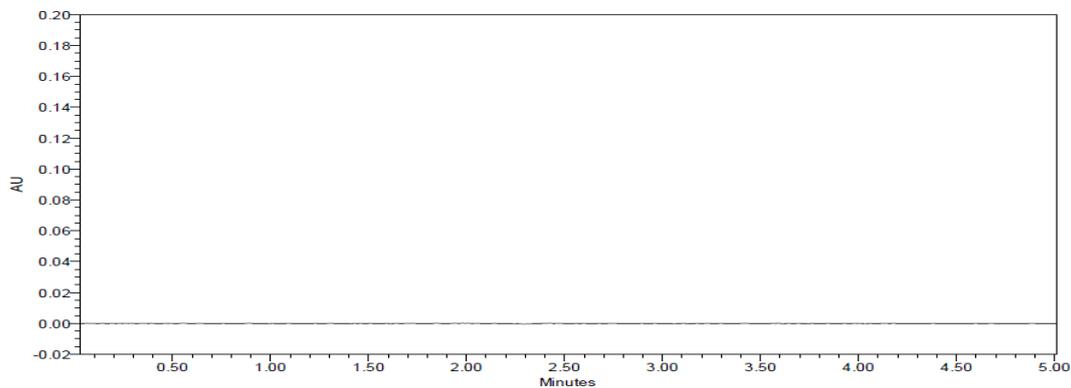

**System suitability chromatogram**

**Discussion:** According to ICH guidelines plate count should be more than 2000, tailing factor should be less than 2 and resolution must be more than 2. All the system suitable parameters were passed and were within the limits.

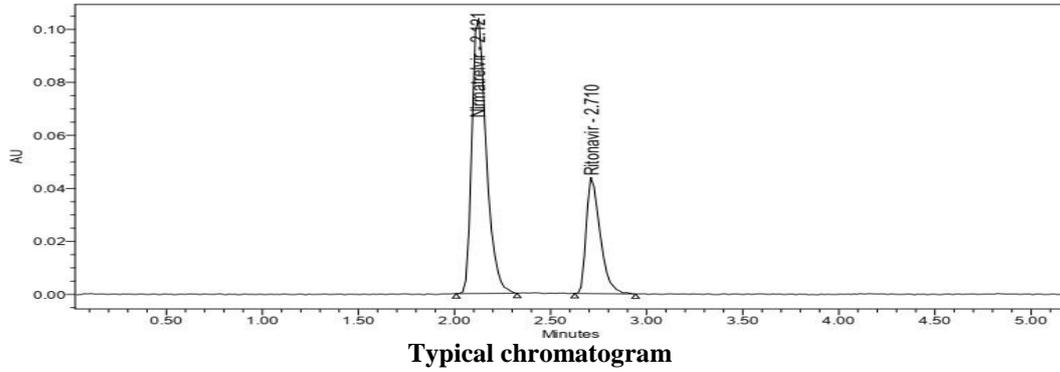

**Discussion:** Retention times of Nirmatrelvir and Ritonavir were 2.116min and 2.704 min respectively. We did not find and interfering peaks in blank and placebo at retention times of these drugs in this method. So this method was said to be specific.

Calibration curve of Ritonavir

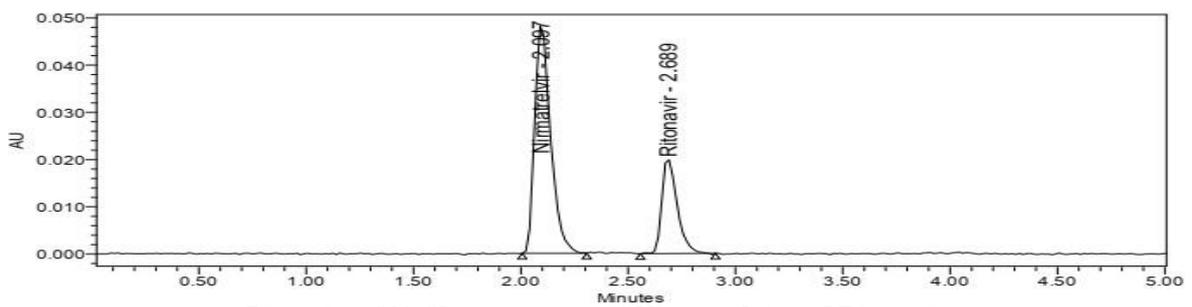

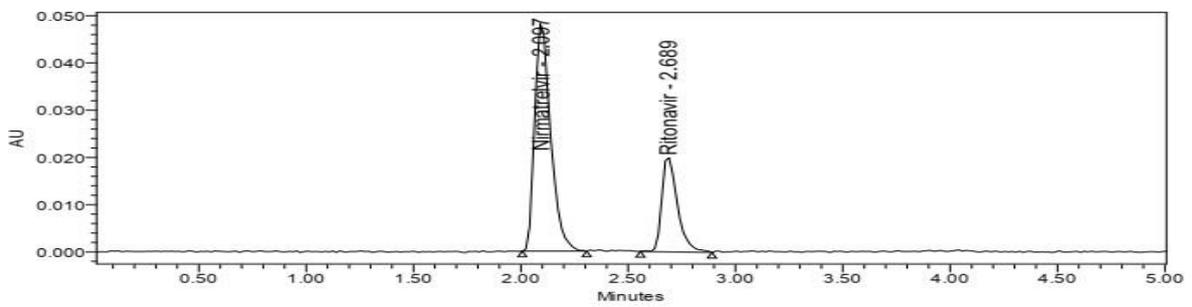

**Discussion**

Six linear concentrations of Nirmatrelvir (3.5-22.5 µg/ml) and Ritonavir (2.25- 13.35µg/ml) were injected in a duplicatemanner. Average areas were mentioned above

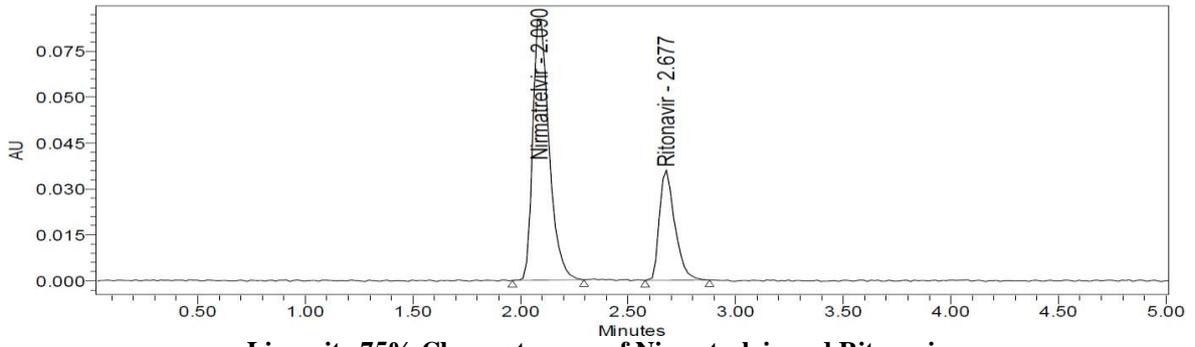

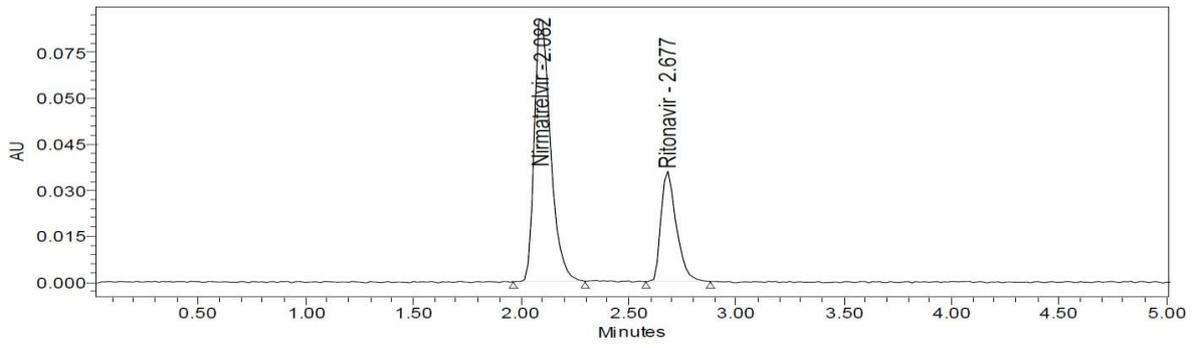

and linearity equations obtained for Nirmatrelvir was  $y = 36515x + 521.64$  and of Ritonavir was  $y = 22617x + 1026.5$  Correlation coefficient obtained was 0.999 for the two drugs.

Mean	546836	221915
S.D	5132.5	1331.1
%RSD	0.9	0.6

**Discussion**

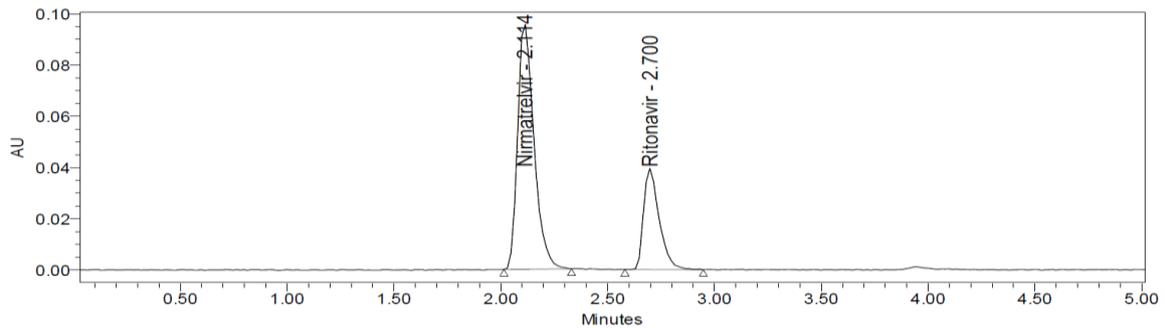

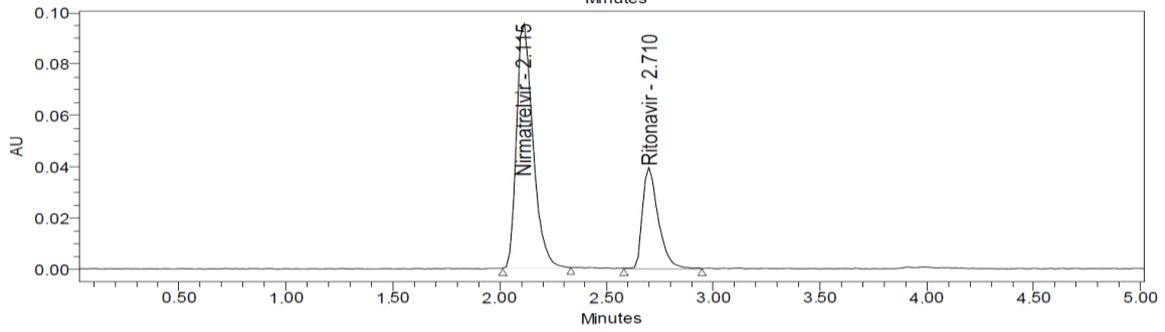

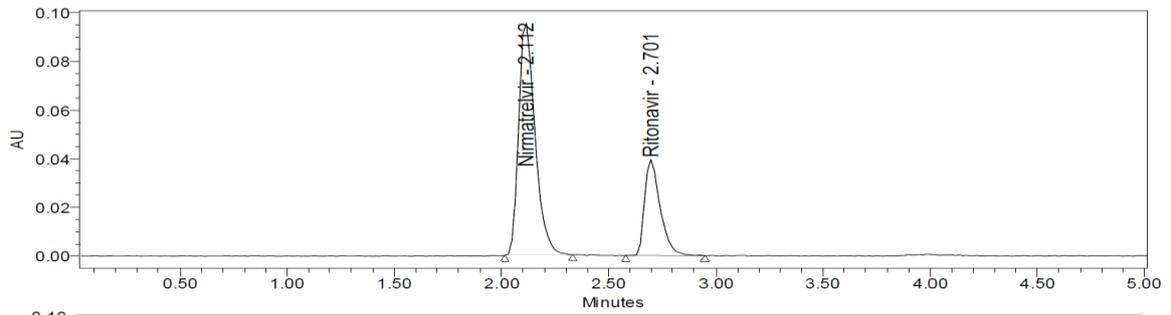

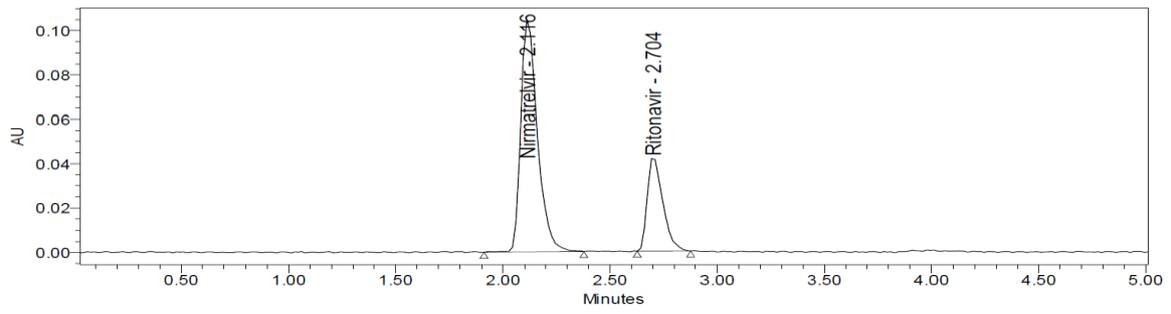

From a single volumetric flask of working standard solution six injections were given and the obtained areas were mentioned above. Average area, standard deviation

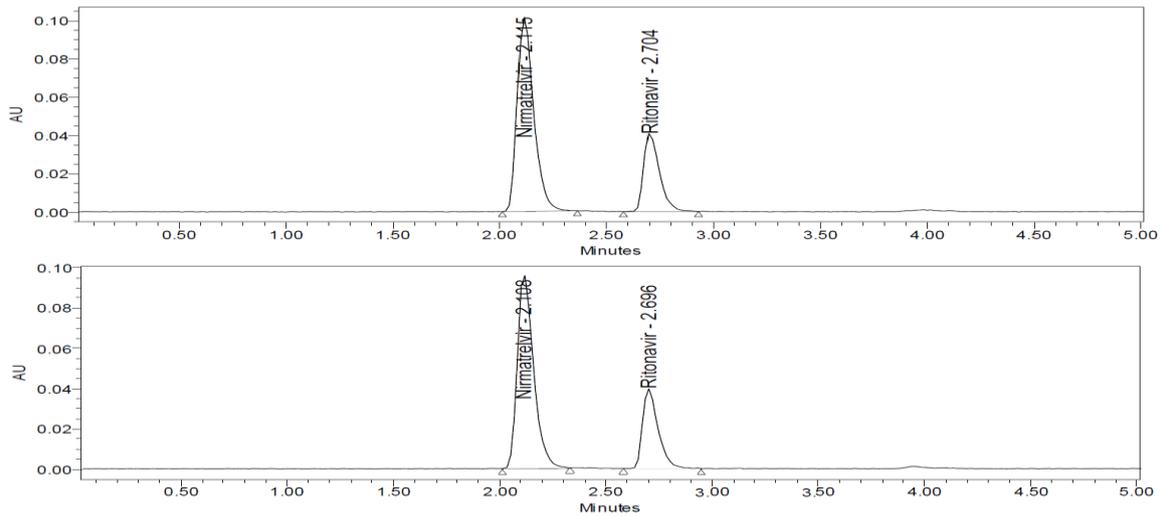

and % RSD were calculated for two drugs. % RSD obtained as 0.9% and 0.6% respectively for Nirmatrelvir and Ritonavir. As the limit of Precision was less than “2” the system precision was passed in this method.

**Repeatability**

**Repeatability table of Nirmatrelvir and Ritonavir**

%RSD	0.3	0.4

**Repeatability chromatogram**

**DISCUSSION**

Multiple sampling from a sample stock solution was done and six working sample solutions of same concentrations were prepared, each injection from each working sample solution was given and obtained areas were mentioned in the above table. Average area,

standard deviation and % RSD were calculated for two drugs and obtained as 0.3% and 0.4% respectively for Nirmatrelvir and Ritonavir. As the limit of Precision was less than “2” the system precision was passed in this method.

## DISCUSSION

Regarding the Ph adjustment in mobile phase for the acid and base degradation studies have movement in retention time of drugs. But due to neutralized acid sample with 2N Base solution and base sample with 2N Acid solution there will be no change in retention time.

## CONCLUSION

A simple, Accurate, precise method was developed for the simultaneous estimation of the Nirmatrelvir and Ritonavirin Tablet dosage form. Retention time of Nirmatrelvir and Ritonavir were found to be 2.121min and 2.710 min. %RSD of the Nirmatrelvir and Ritonavir were found to be 0.9 and 0.6 respectively. %Recovery was obtained as 99.33% and 99.71% for Nirmatrelvir and Ritonavir respectively. LOD, LOQ values obtained from regression equations of Nirmatrelvir and Ritonavir were 0.02, 0.07 and 0.06, 0.17 respectively. Regression equation of Nirmatrelvir is  $y = 36515.x + 521.64$ , and of  $y = 22617x + 1026.5$ . Ritonavir. Retention times were decreased and that run time was decreased, so the method developed was simple and economical that can be adopted in regular Quality control test in Industries.
